Introduction

Project background and context

- This project was meant to predict if the Falcon 9's first stage will successfully land. SpaceX says that the cost to launch the Falcon 9 is 62 million dollars. Some of SpaceX's competitors can cost 165 million dollars to launch. The reason SpaceX has their price so cheap is because they can reuse the first stage of the launch. If we can determine if the stage will land, we can determine what the cost of the launch will be.

Problems you want to find answers

- What characteristics determine a successful landing vs a failed landing
- What effects does each relationship of the rocket's variables have on the success/failure of each landing
- What conditions allow SpaceX achieve the best success rate

Section 1

Methodology

Methodology

Executive Summary

Data collection methodology:

SpaceX REST API

Web Scraping Wikipedia

Perform data wrangling

Dropping unneeded columns

One hot encoding for classification models

Perform exploratory data analysis (EDA) using visualization and SQL

Perform interactive visual analytics using Folium and Plotly Dash

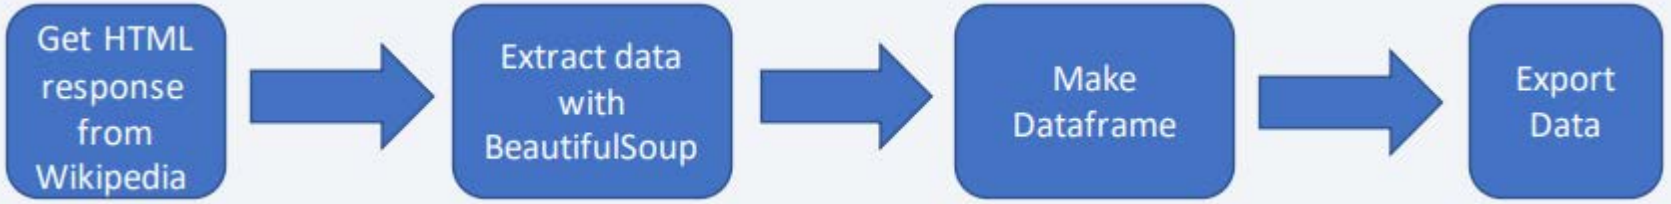
Perform predictive analysis using classification models

How to build, tune, evaluate classification models

Data Collection

- Describe how data sets were collected.
  - The data sets were collected from SpaceX REST API and from web scrapping Wiki
  - The API produced info on rockets, launches, and payload

  - Web scraping Wiki also produced rockets, launches, and payload information



Data Collection – SpaceX API

GITHUB link

1. Getting Response from API

```
spacex_url="https://api.spacexdata.com/v4/launches/past"
response = requests.get(spacex_url)
```

2. Convert Response to JSON File

```
data = response.json()
data = pd.json_normalize(data)
```

3. Transform data

```
getLaunchSite(data)
getPayloadData(data)
getCoreData(data)
getBoosterVersion(data)
```

4. Create dictionary with data

```
launch_dict = {'FlightNumber': list(data['flight_number']),
'Date': list(data['date']),
'BoosterVersion':BoosterVersion,
'PayloadMass':PayloadMass,
'Orbit':Orbit,
'LaunchSite':LaunchSite,
'Outcome':Outcome,
'Flights':Flights,
'GridFins':GridFins,
'Reused':Reused,
'Legs':Legs,
'LandingPad':LandingPad,
'Block':Block,
'ReusedCount':ReusedCount,
'Serial':Serial,
'Longitude': Longitude,
'Latitude': Latitude}
```

5. Create dataframe

```
data = pd.DataFrame.from_dict(launch_dict)
```

6. Filter dataframe

```
data_falcon9 = data[data['BoosterVersion']!='Falcon 1']
```

7. Export to file

```
data_falcon9.to_csv('dataset_part_1.csv', index=False)
```

Data Collection - Scraping

GITHUB link

1. Getting Response from HTML

```
response = requests.get(static_url)
```

2. Create BeautifulSoup Object

```
soup = BeautifulSoup(response.text, "html5lib")
```

3. Find all tables

```
html_tables = soup.findAll('table')
```

4. Get column names

```
for th in first_launch_table.find_all('th'):
    name = extract_column_from_header(th)
    if name is not None and len(name) > 0 :
        column_names.append(name)
```

5. Create dictionary

```
launch_dict= dict.fromkeys(column_names)

# Remove an irrelvant column
del launch_dict['Date and time ( )']

# Let's initial the launch_dict with each value to be an empty list
launch_dict['Flight No.'] = []
launch_dict['Launch site'] = []
launch_dict['Payload'] = []
launch_dict['Payload mass'] = []
launch_dict['Orbit'] = []
launch_dict['Customer'] = []
launch_dict['Launch outcome'] = []
# Added some new columns
launch_dict['Version Booster']=[]
launch_dict['Booster landing']=[]
launch_dict['Date']=[]
launch_dict['Time']=[]
```

6. Add data to keys

```
extracted_row = 0
#Extract each table
for table_number,table in enumerate(soup.find_all
   # get table row
    for rows in table.find_all("tr"):
        #check to see if first table heading is a
        if rows.th:
            if rows.th.string:
                flight_number=rows.th.string.stri
                flag=flight_number.isdigit()
```

See notebook for the rest of code

7. Create dataframe from dictionary

```
df=pd.DataFrame(launch_dict)
```

8. Export to file

```
df.to_csv('spacex_web_scraped.csv', index=False)
```

Data Wrangling

GITHUB link

- The dataset showed that there were several cases where the booster didn't land successfully
- I also transformed strings into categorical variables, 1 meaning success and 0 is failure

1. Calculate launches number for each site

```
df['LaunchSite'].value_counts()
```

```
CCAFS SLC 40    55
KSC LC 39A      22
VAFB SLC 4E     13
Name: LaunchSite, dtype: int64
```

2. Calculate the number and occurence of each orbit

```
df['Orbit'].value_counts()
```

```
GTO      27
ISS      21
VLEO     14
PO        9
LEO       7
SSO       5
MEO       3
SO        1
ES-L1     1
HEO       1
GEO       1
Name: Orbit, dtype: int64
```

3. Calculate number and occurrence of mission outcome per orbit type

```
landing_outcomes = df['Outcome'].value_counts()
landing_outcomes
```

```
True ASDS       41
None None       19
True RTLS       14
False ASDS       6
True Ocean       5
None ASDS        2
False Ocean      2
False RTLS       1
Name: Outcome, dtype: int64
```

4. Create landing outcome label from Outcome column

```
landing_class = []
for key,value in df["Outcome"].items():
    if value in bad_outcomes:
        landing_class.append(0)
    else:
        landing_class.append(1)
df['Class']=landing_class
```

5. Export to file

```
df.to_csv("dataset_part_2.csv", index=False)
```

EDA with Data Visualization

GITHUB link

- Scatter Graph
  - Flight Number vs Payload Mass
  - Flight Number vs Launch Site
  - Payload vs Launch Site
  - Orbit vs Flight Number
  - Payload vs Orbit

  Scatter plots show relationships between variables

- Line Graph
  - Success Rate vs Year

  Shows data vars and their trends

- Bar Graph
  - Success Rate vs Orbit

  Shows the relationships between numeric and categorical vars

EDA with SQL

GITHUB link

- SQL queries were used to gather and understand data from the dataset
  - Display
    - Names of the launch sites
    - First 5 records starting with “CAA”
    - Total payload carried by boosters from NASA
    - Avg payload carried by booster F9
  - List
    - Date of first successful landing outcome on ground pad
    - Names of the boosters that have success in drone ship
      - 4000 < MASS < 6000
    - Number of successful/failure mission outcomes

Build an Interactive Map with Folium

GITHUB link

Folium is a map that I centered around NASA Space Center

- Red circle at NASA Johnson Space Center's coordinate with label showing its name
- Red circles at each launch site coordinates with label showing launch site name
- The grouping of points in a cluster to display multiple and different information for the same coordinates
- Markers to show successful and unsuccessful landings. Green for successful landing and Red for unsuccessful landing
- Markers to show distance between launch site to key and plot a line between them

Build a Dashboard with Plotly Dash

GITHUB link

- My dashboard has a dropdown, pie chart, range slider, and a scatter plot
  - Dropdown allows a user to choose the launch site or all launch sites
  - Pie chart shows the total success and the total failure for the launch site chosen with the
  - Range slider allows a user to select a payload mass in a fixed range
  - Scatter chart shows the relationship between two variables, in particular Success vs Payload Mass

Predictive Analysis (Classification)

GITHUB link

- Data prep
  - Load dataset, normalize data, then split the data into training and testing sets
- Model prep
  - Select proper ML models, set parameters, then train models with the training data set
- Model eval
  - Find best hyperparameters for each model type, computer accuracy for each model with the testing set, then plot the confusion matrix
- Model comp
  - Compare the models according to their accuracy and the model with the best accuracy is chosen

Results

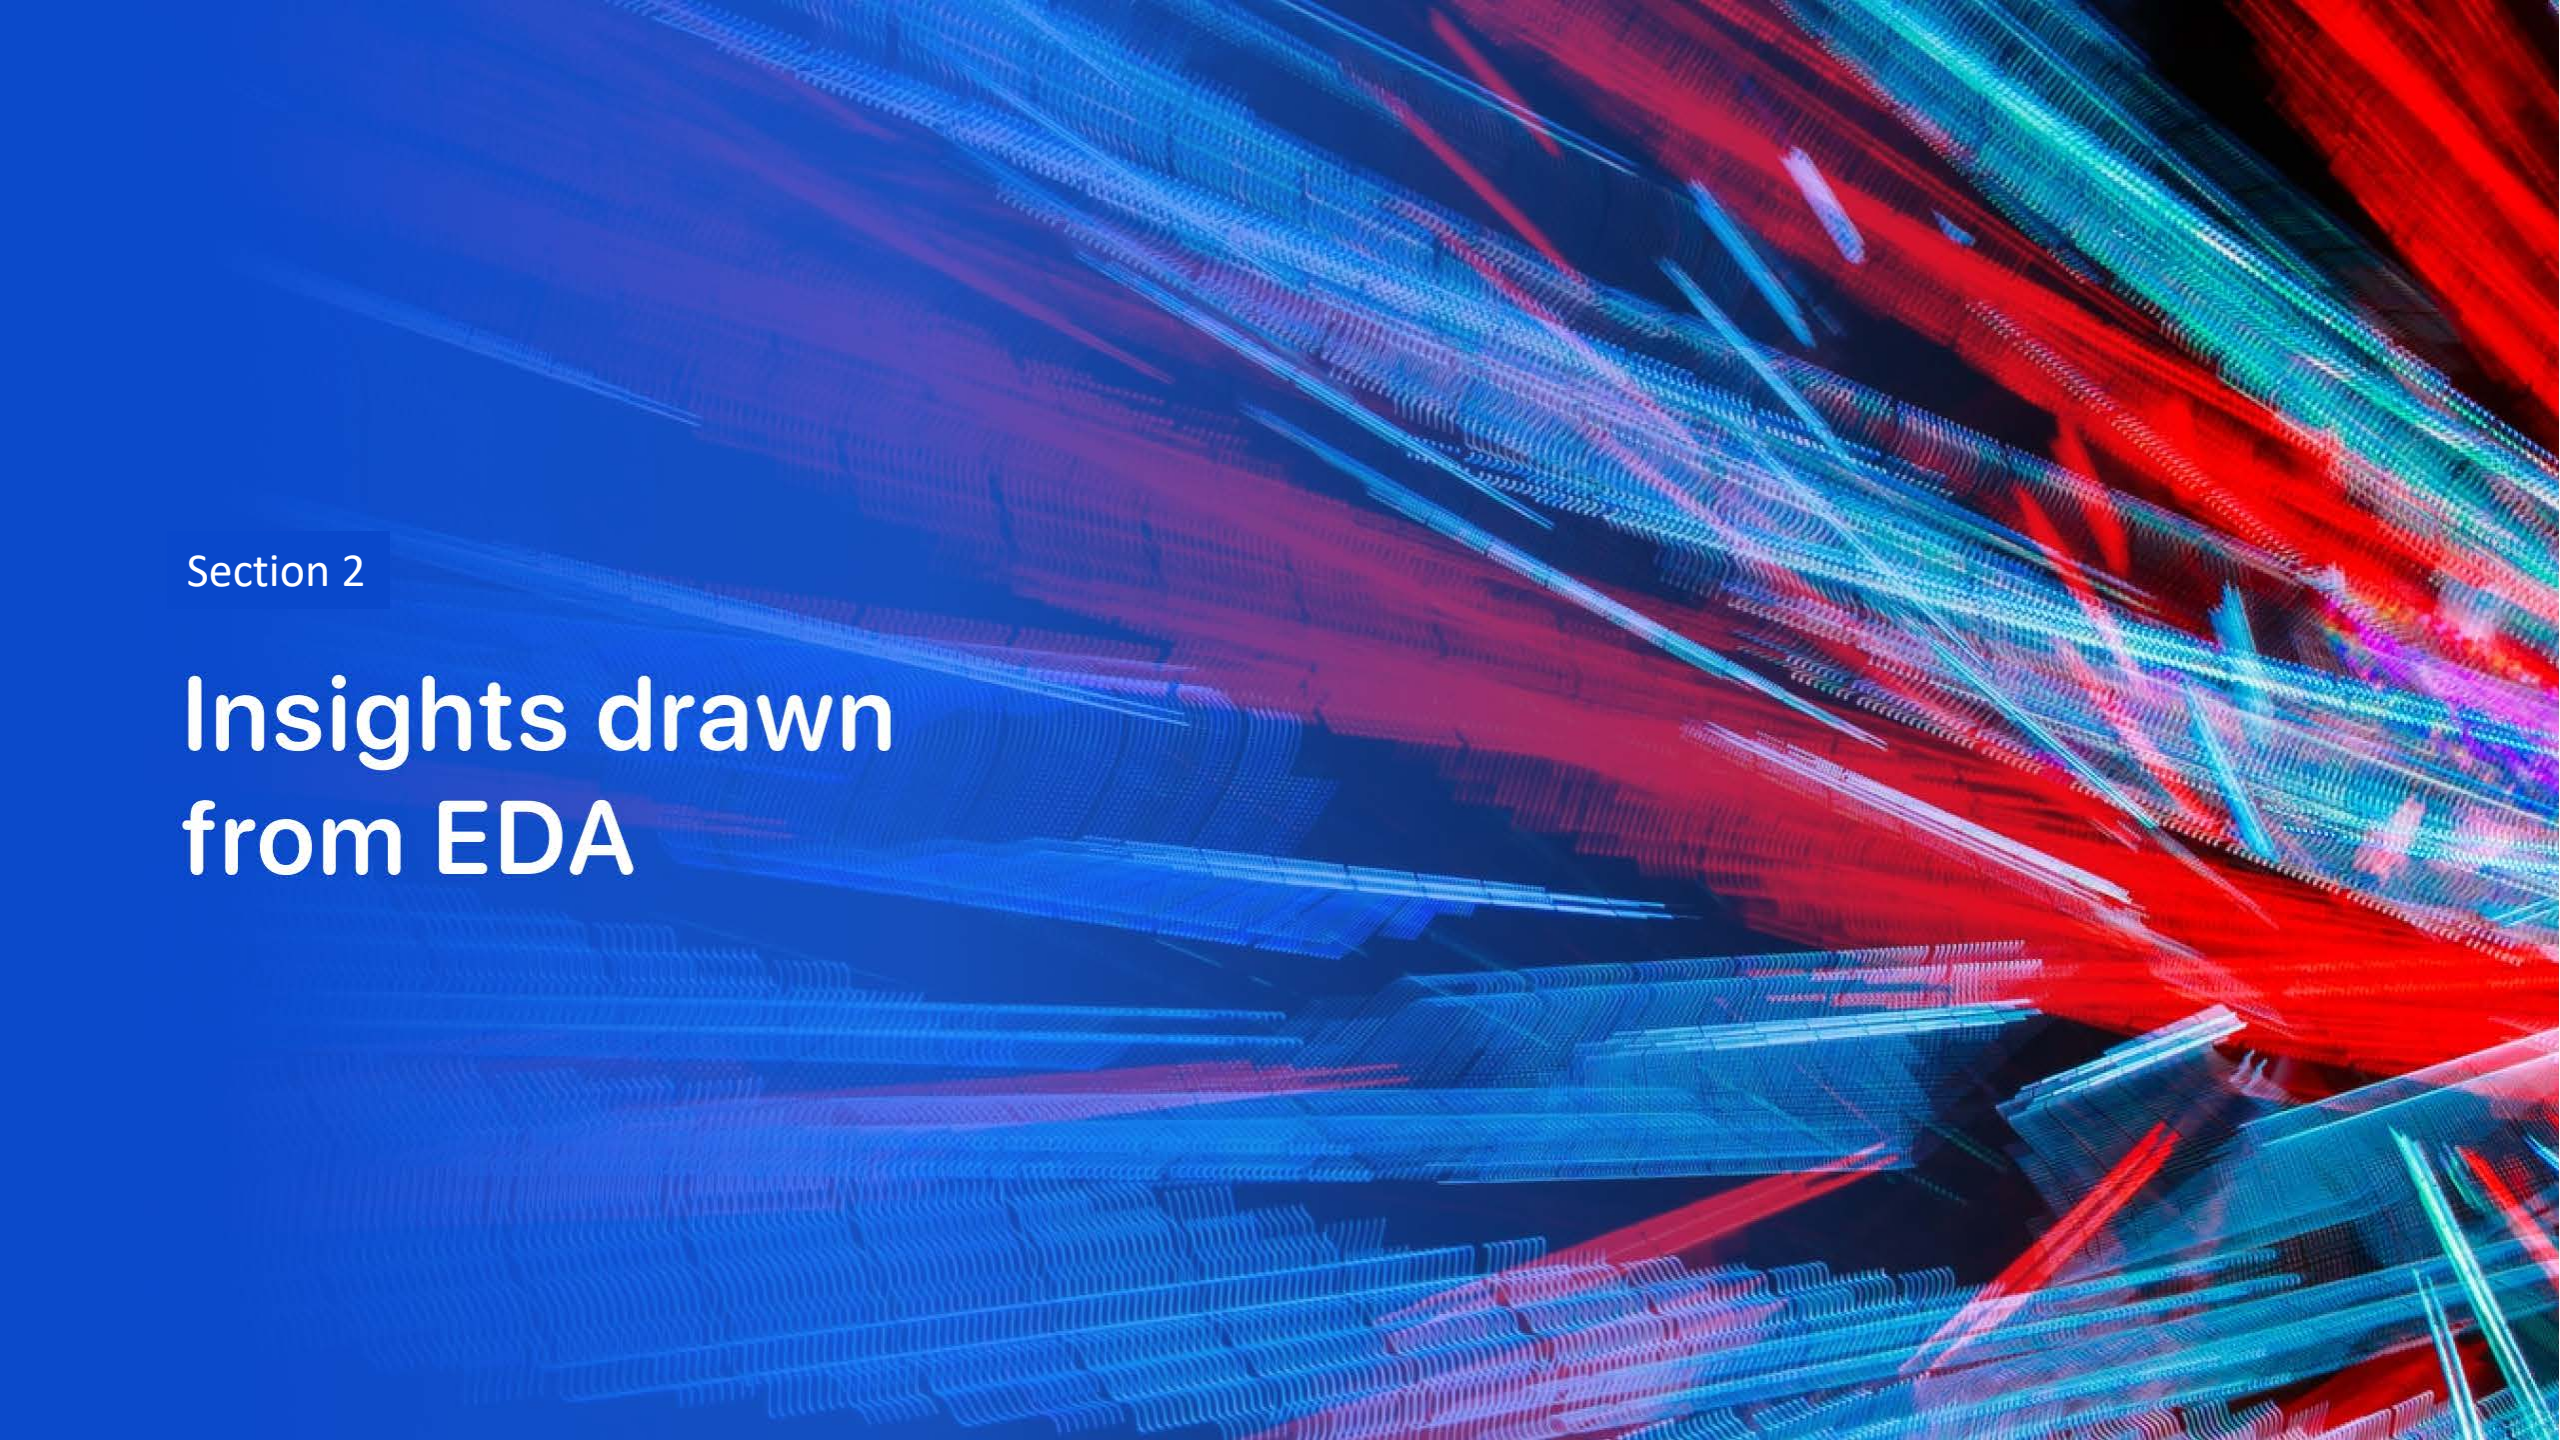
Exploratory data analysis results

Interactive analytics demo in screenshots

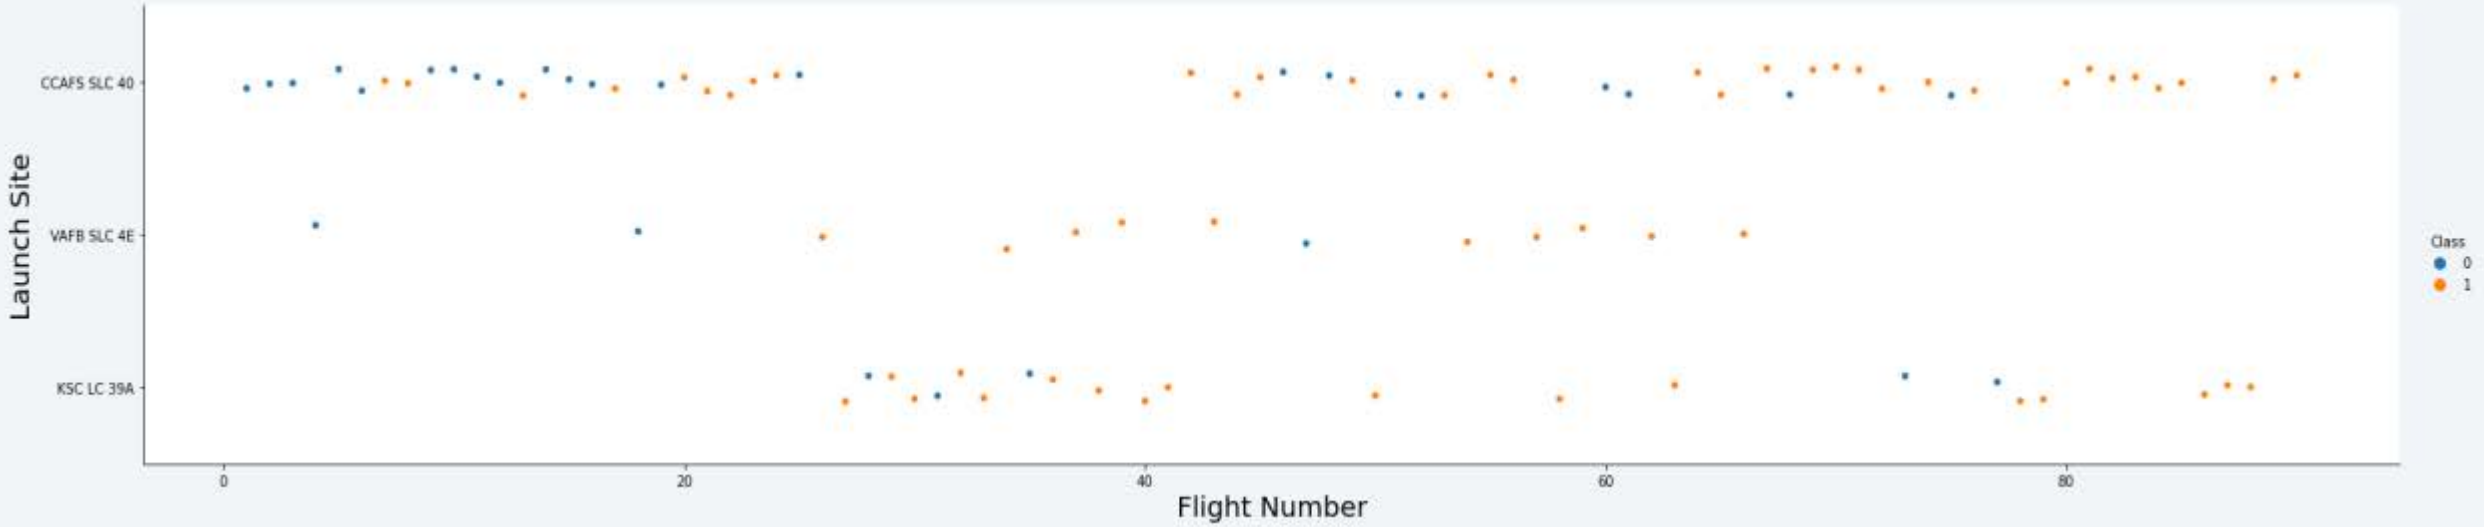
Predictive analysis results

Section 2

Insights drawn from EDA

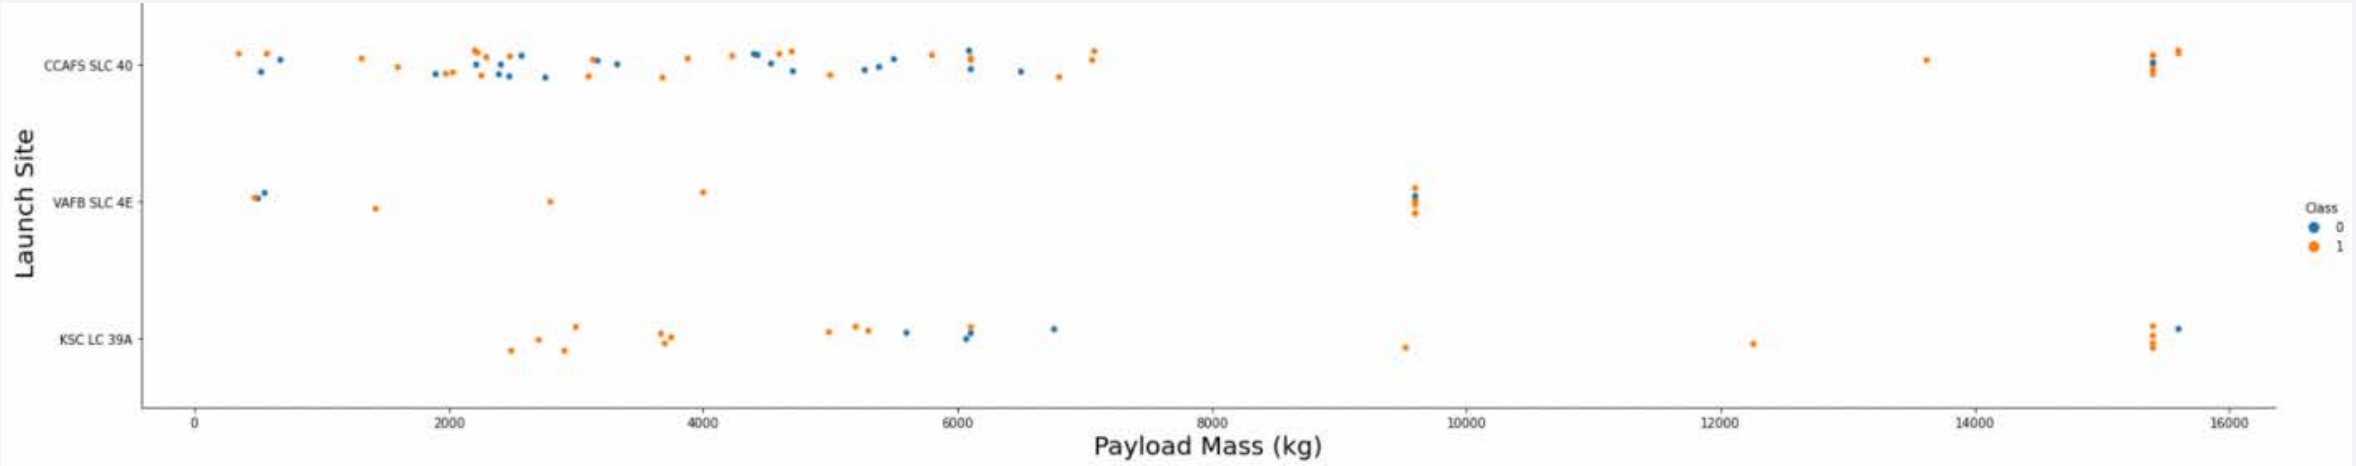


Flight Number vs. Launch Site



- The earliest flights all failed while the latest flights all succeeded
- The CCAFS SLC 40 launch site has about a half of all launches
- VAFB SLC 4E and KSC LC 39A have higher success rates
- It can be assumed that each new launch has a higher rate of success

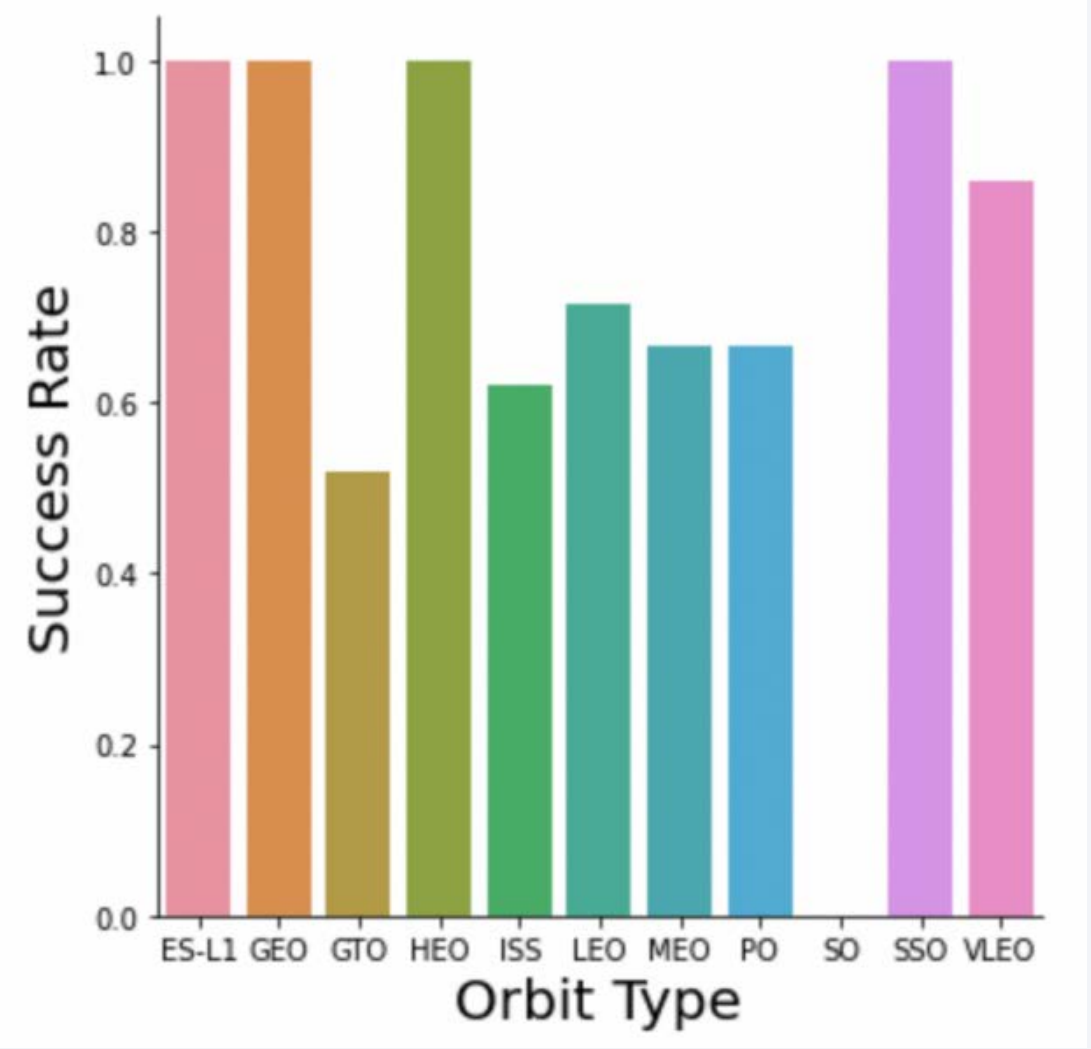
Payload vs. Launch Site



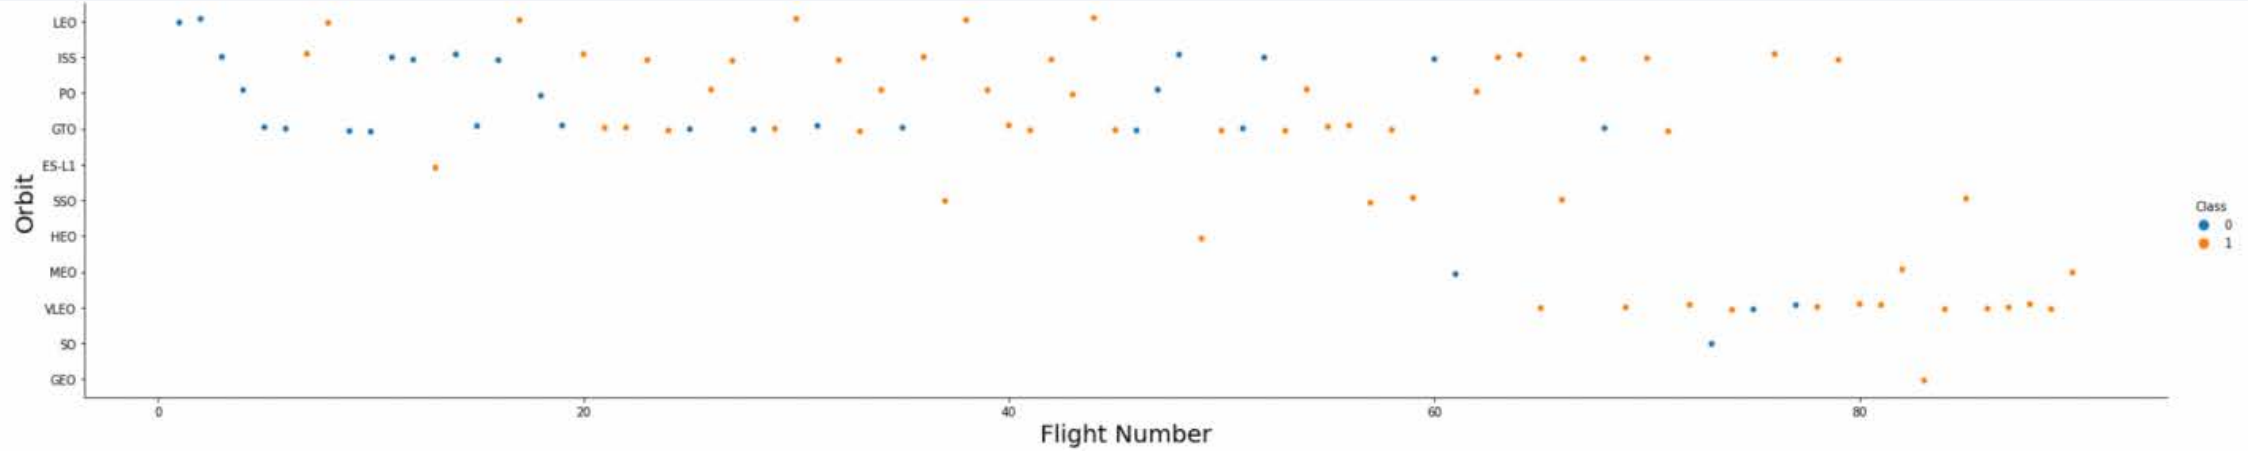
- For every launch site the higher the payload mass, the higher the success rate
- Most of the launches with payload mass over 7000 kg were successful
- KSC LC 39A has a 100% success rate for payload mass under 5500 kg too

Success Rate vs. Orbit Type

- 100% Success rate
  - ES-L1, GEO, HEO, SSO
- 50%-85% Success rate
  - GTO, ISS, LEO, MEO, PO, VLEO
- 0% Success rate
  - SO

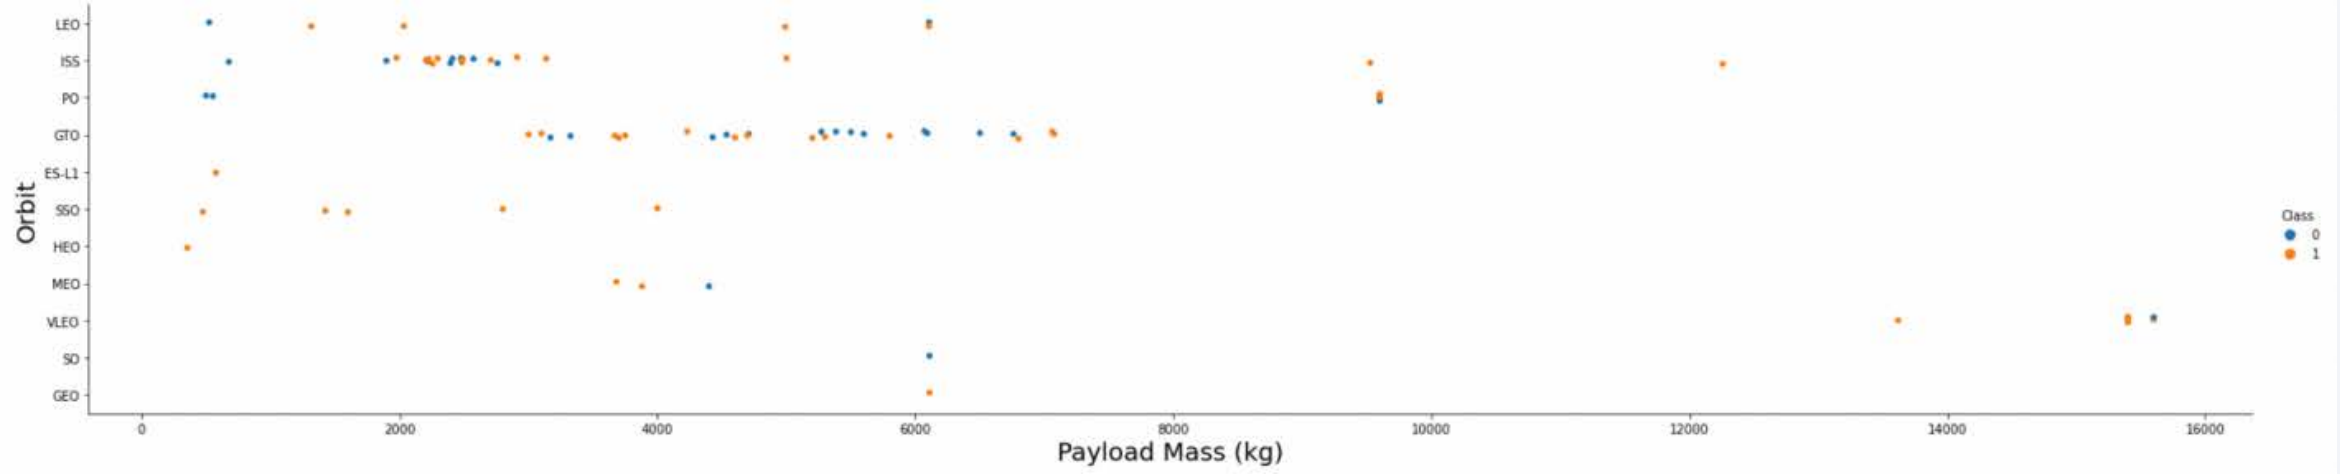


Flight Number vs. Orbit Type



In the LEO orbit the Success appears related to the number of flights; however, there seems to be no relationship between flight number when in GTO orbit.

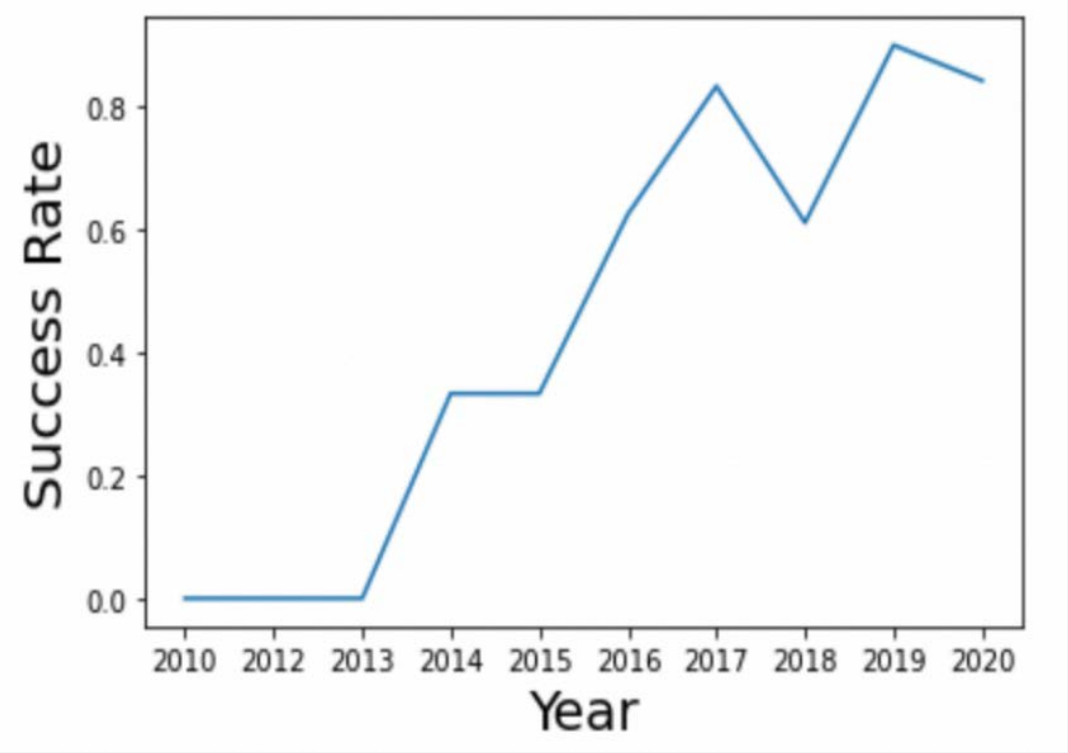
Payload vs. Orbit Type



Heavy payloads have a negative influence on GTO orbits and positive on GTO and Polar LEO orbits.

Launch Success Yearly Trend

The success rate increased from 2010 until 2020 with a slight dip in 2018



All Launch Site Names

```
In [4]: %sql select distinct launch_site from SPACEXDATASET;

F9 B5 B1060.2
F9 B5 B1058.3
F9 B5 B1051.6
F9 B5 B1060.3
F9 B5 B1049.7

Listing the names of the booster versions which have carried the maximum payload mass

2015 Launch Records

```
In [12]: %%sql select monthname(date) as month, date, booster_version, launch_site, landing__outcome from SPACEXDATASET
         where landing__outcome = 'Failure (drone ship)' and year(date)=2015;

 * ibm_db_sa://wzf08322:***@0c77d6f2-5da9-48a9-81f8-86b520b87518.bs2io90108kqb1od8lcg.databases.appdomain.cloud:31198/bludb
Done.
```

Out[12]:

MONTH	DATE	booster_version	launch_site	landing__outcome
January	2015-01-10	F9 v1.1 B1012	CCAFS LC-40	Failure (drone ship)
April	2015-04-14	F9 v1.1 B1015	CCAFS LC-40	Failure (drone ship)

Listing the failed landing outcomes in drone ship, their booster versions and launch site names for the months in year 2015

Rank Landing Outcomes Between 2010-06-04 and 2017-03-20

```
In [13]: %%sql select landing__outcome, count(*) as count_outcomes from SPACEXDATASET
             where date between '2010-06-04' and '2017-03-20'
             group by landing__outcome
             order by count_outcomes desc;
```

```
 * ibm_db_sa://wzf08322:***@0c77d6f2-5da9-48a9-81f8-86b520b87518.bs2io90l08kqb1od8lcg.databases.appdomain.cloud:31198/bludb
Done.
```

Out[13]:

landing__outcome	count_outcomes
No attempt	10
Failure (drone ship)	5
Success (drone ship)	5
Controlled (ocean)	3
Success (ground pad)	3
Failure (parachute)	2
Uncontrolled (ocean)	2
Precluded (drone ship)	1

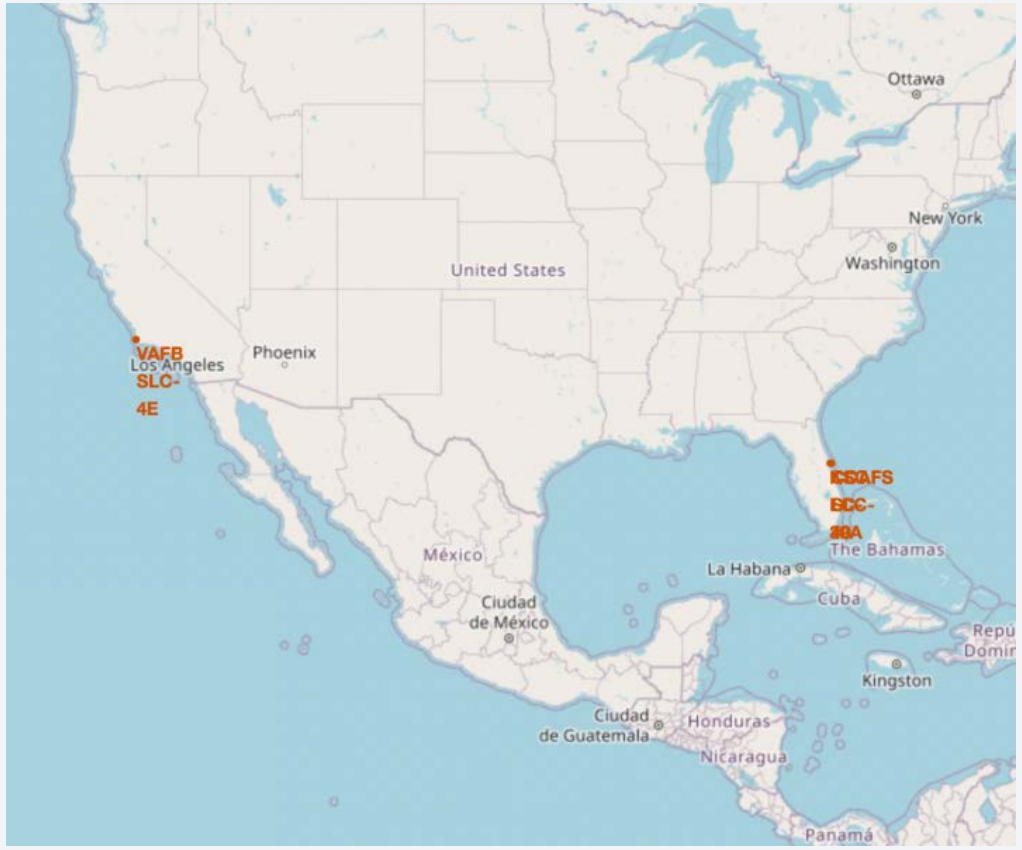
Ranking the count of landing outcomes between the date 2010-06-04 and 2017-03-20 in descending order

Section 3
Launch Sites
Proximities Analysis

Launch Site Locations

• Most of Launch sites are in proximity to the Equator line. The land is moving faster at the equator than any other place on the surface of the Earth. Anything on the surface of the Earth at the equator is already moving at 1670 km/hour. If a ship is launched from the equator it goes up into space, and it is also moving around the Earth at the same speed it was moving before launching. This is because of inertia. This speed will help the spacecraft keep up a good enough speed to stay in orbit.

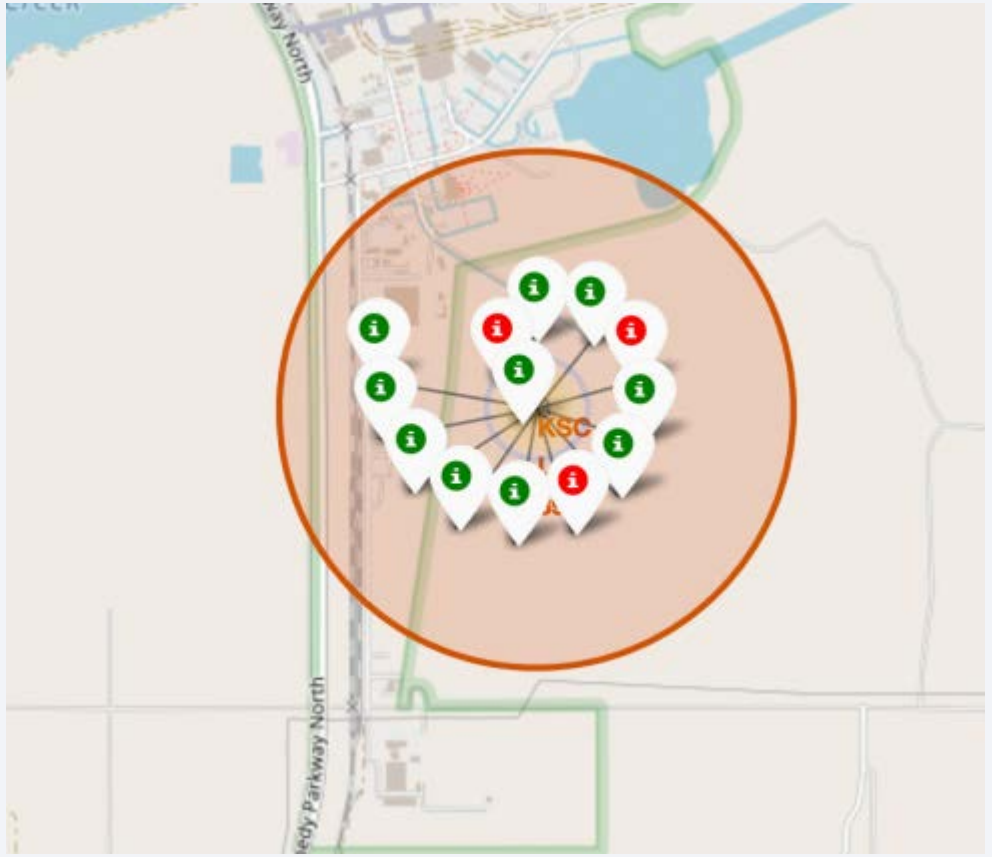
• All launch sites are in very close proximity to the coast, while launching rockets towards the ocean it minimizes the risk of having any debris dropping or exploding near people.



Colored Launch Records

- From the color-labeled markers we should be able to easily identify which launch sites have relatively high success rates.
- Green Marker = Successful Launch
- Red Marker = Failed Launch

- Launch Site KSC LC-39A has a very high Success Rate.

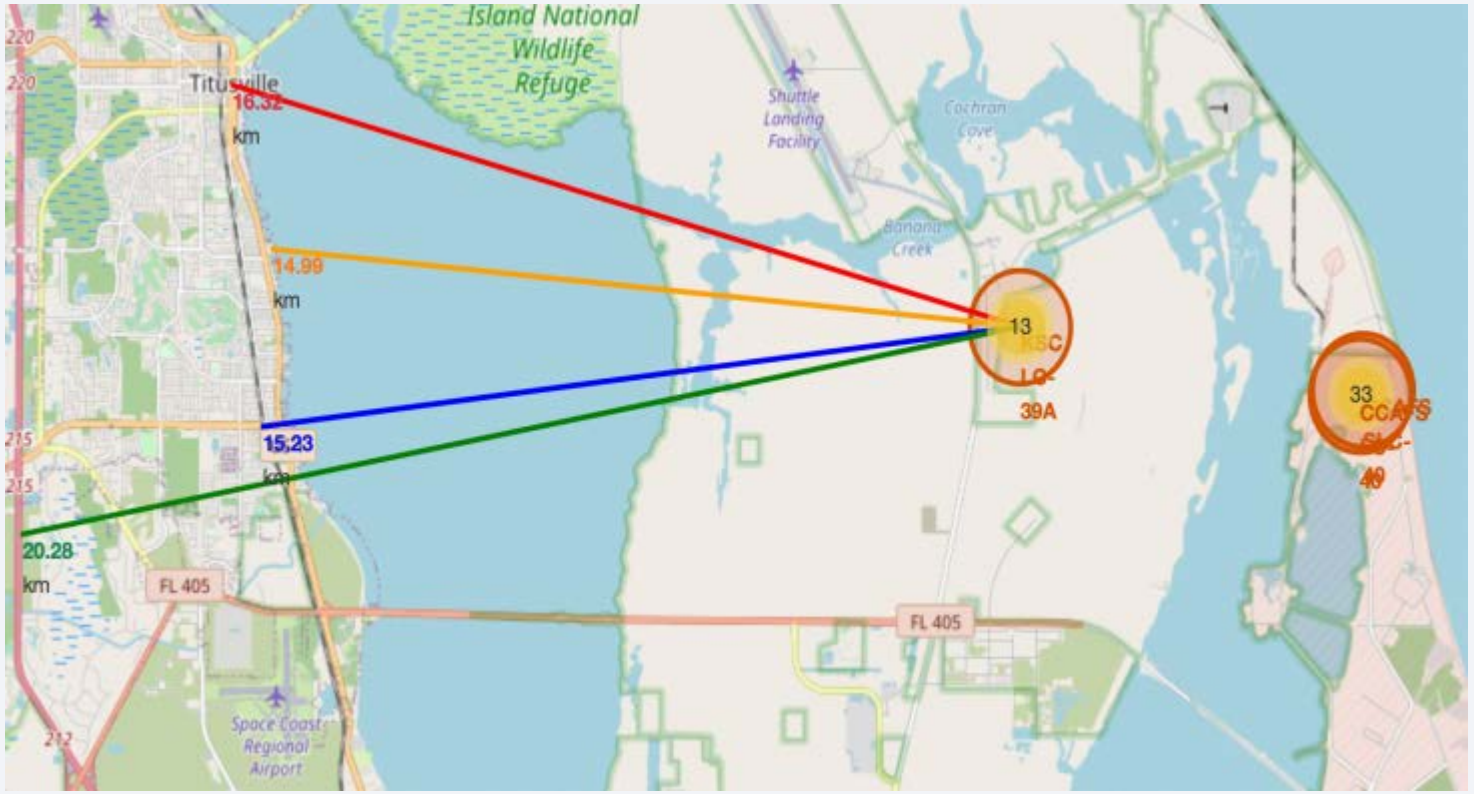


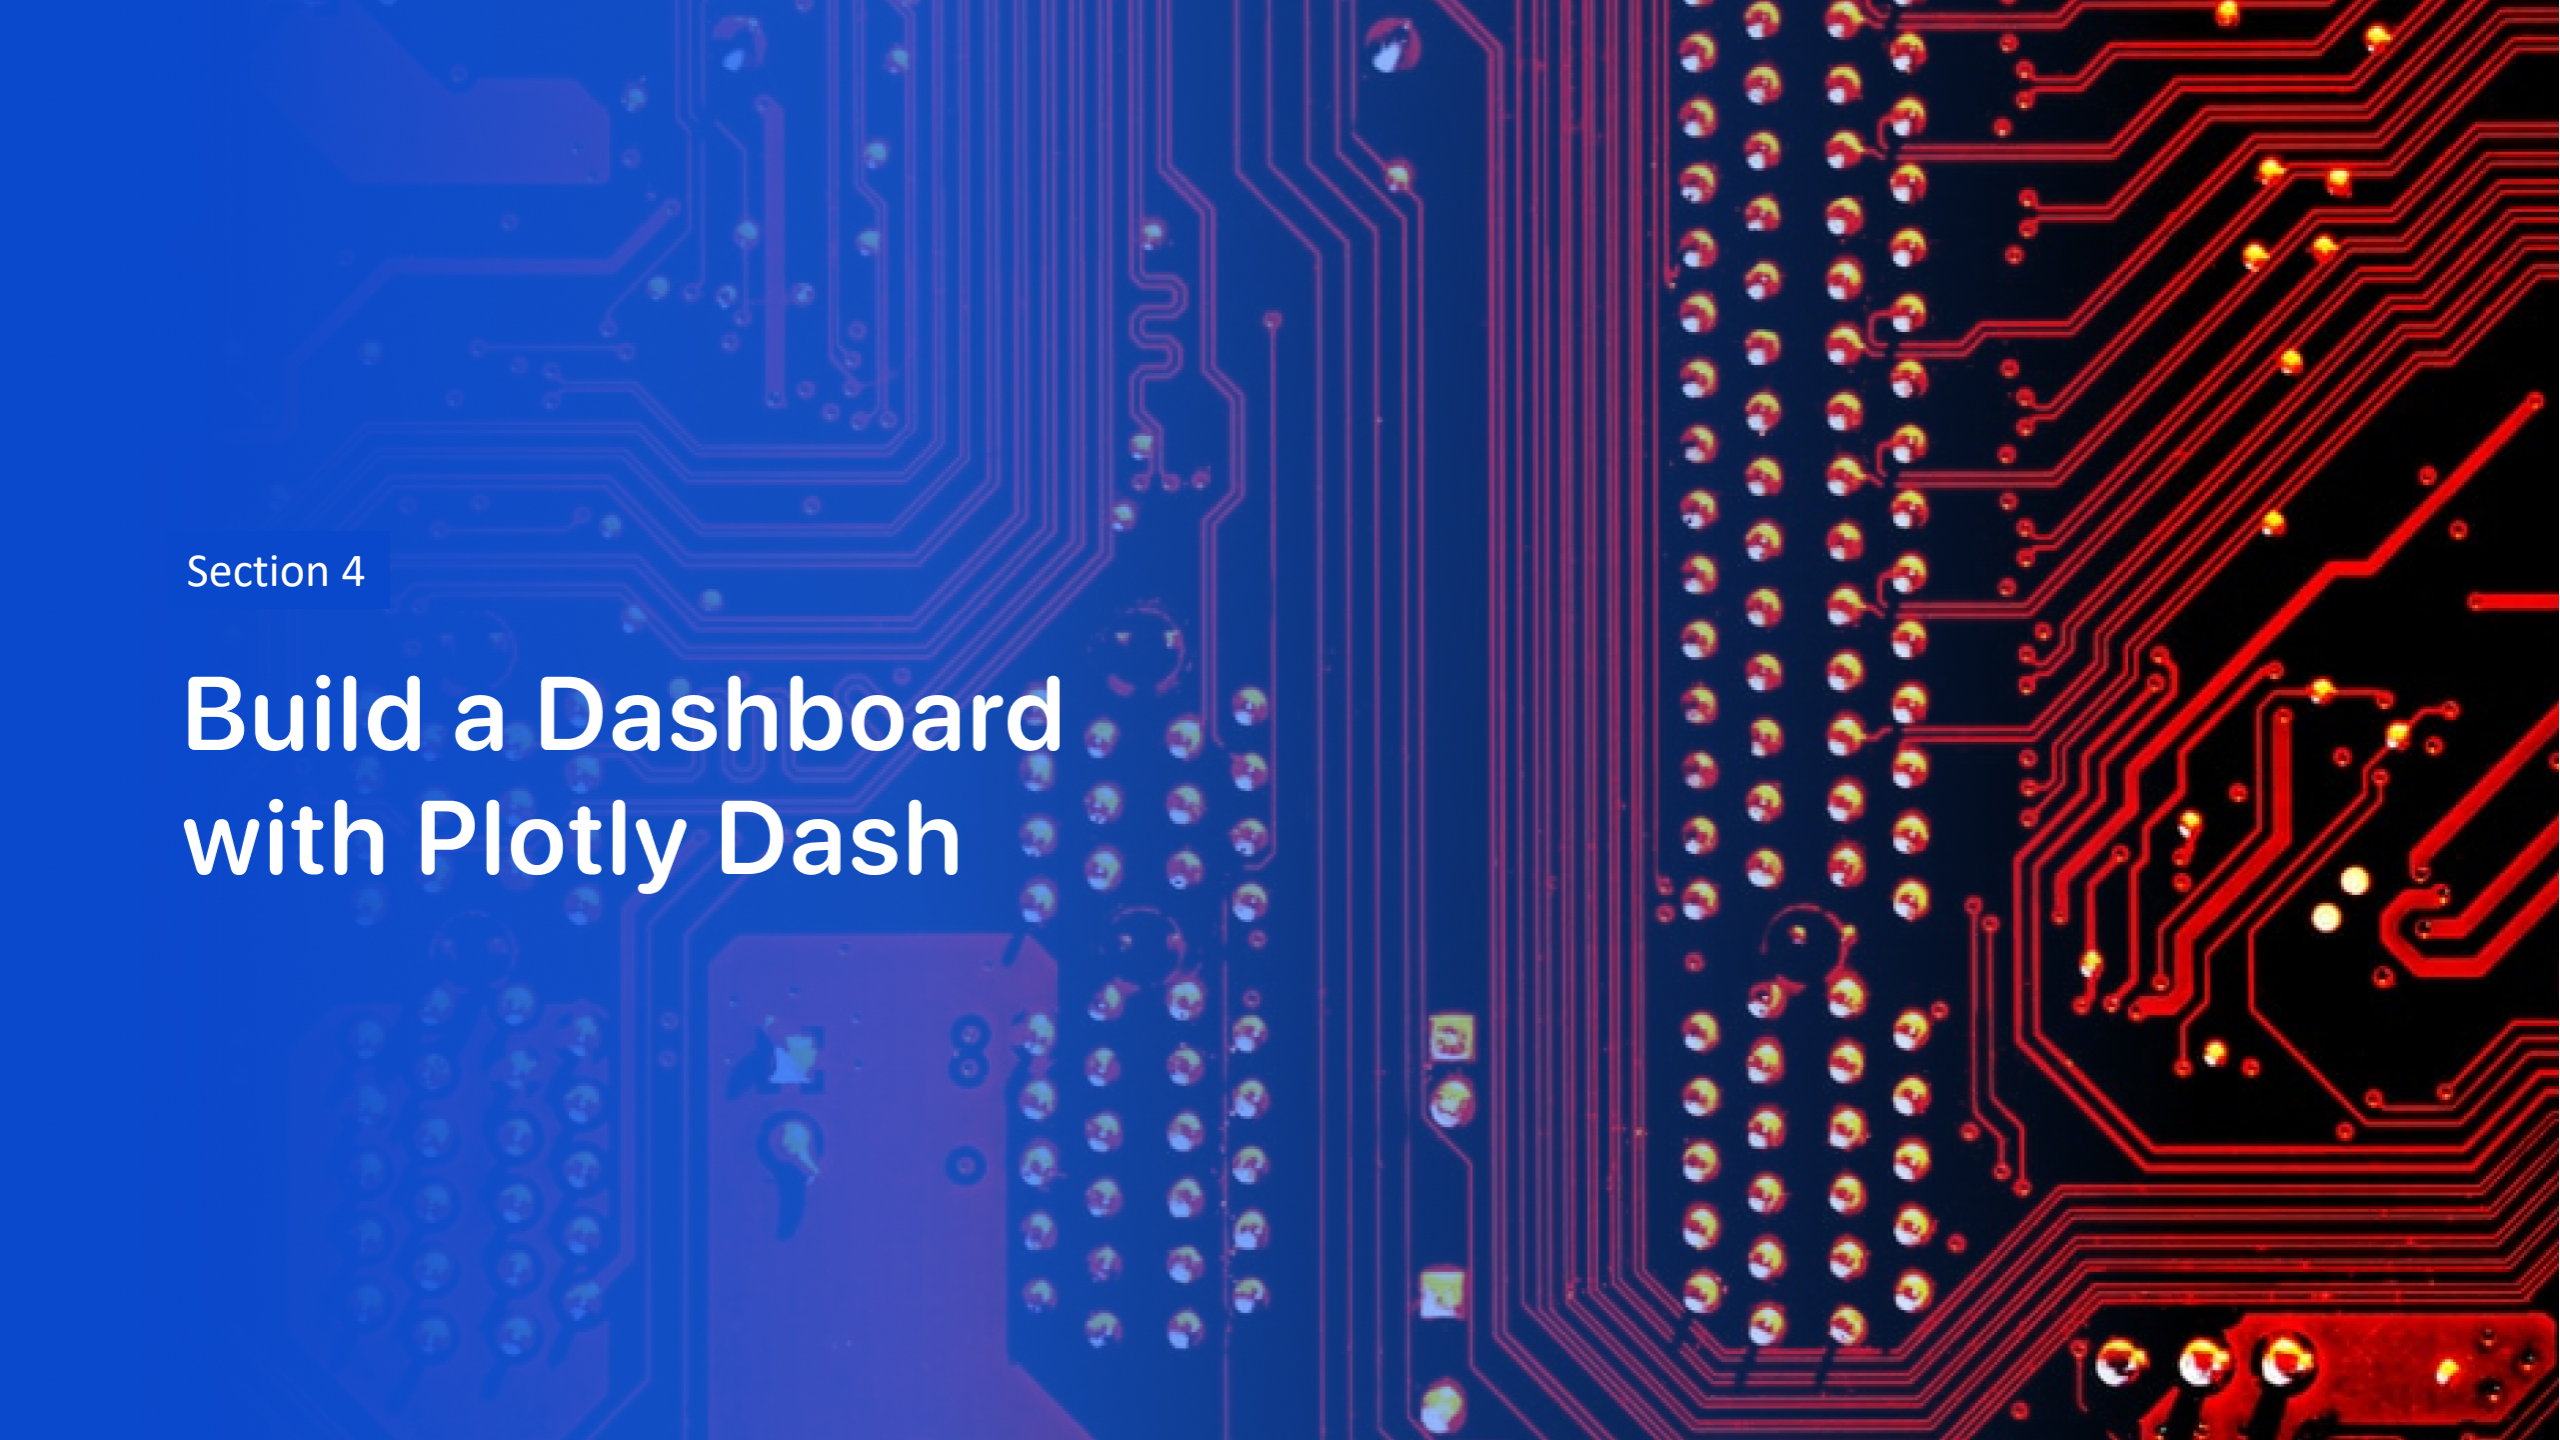
Distance from the Launch Sites

• From the visual analysis of the launch site KSC LC-39A we can clearly see that it is:
- relative close to railway (15.23 km)
- relative close to highway (20.28 km)
- relative close to coastline (14.99 km)

• Also, the launch site KSC LC-39A is relatively close to its closest city Titusville (16.32 km).

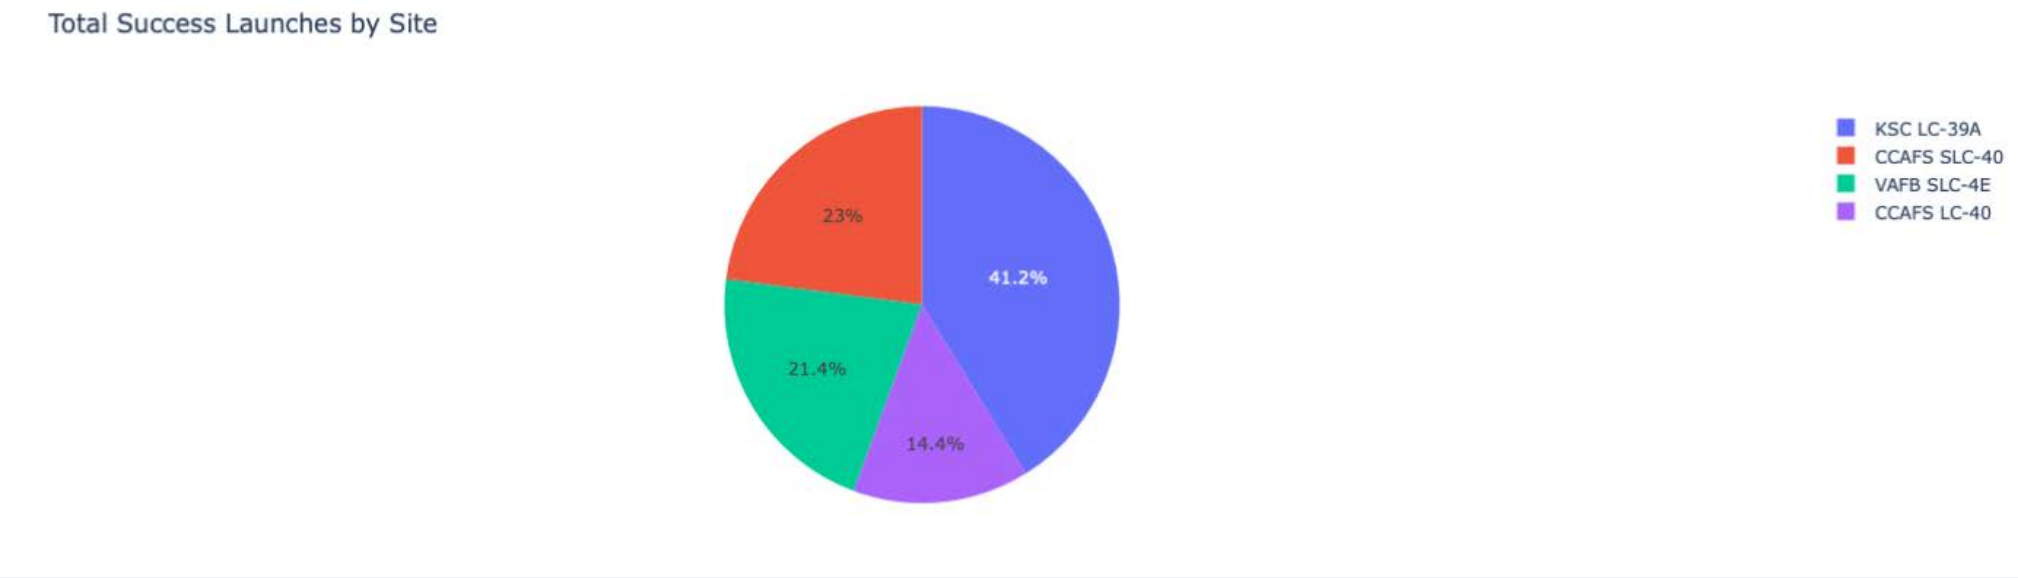
• Failed rocket with its high speed can cover distances like 15-20 km in few seconds. It could be potentially dangerous to populated areas.





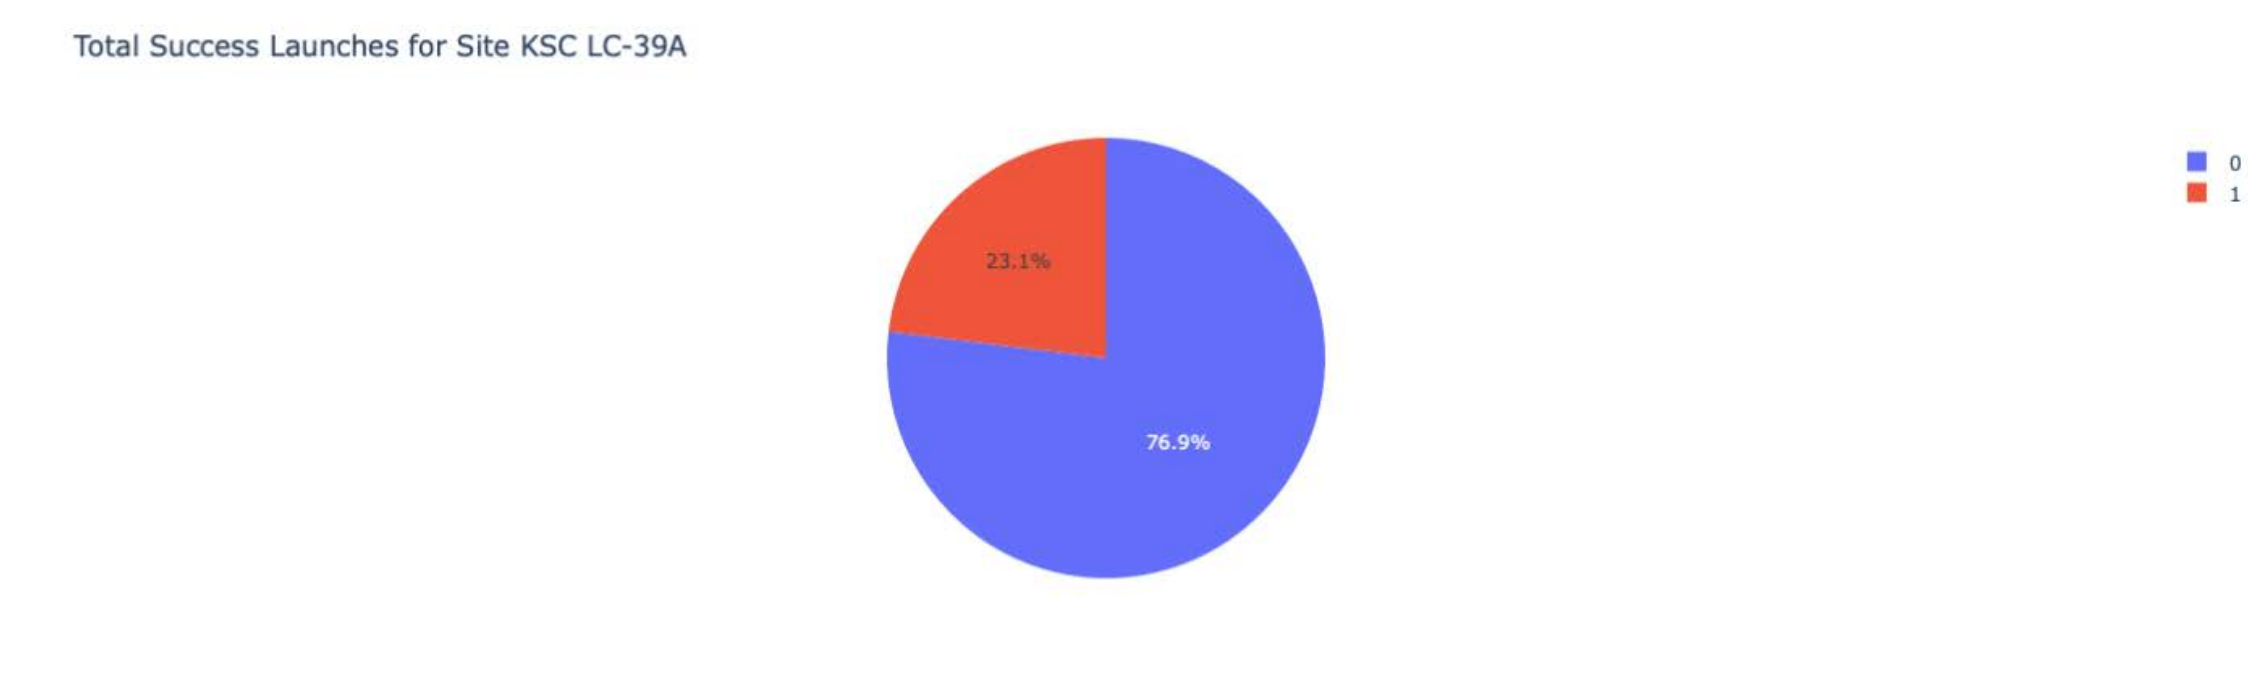
Section 4
Build a Dashboard with Plotly Dash

Launch Success Count



The chart clearly shows that from all the sites, KSC LC-39A has the most successful launches.

Launch Site Success Ratio



KSC LC-39A has the highest launch success rate (76.9%) with 10 successful and only 3 failed landings.

Payload Mass vs Launch Outcome

The charts show that payloads between 2000 and 5500 kg have the highest success rate.

Section 5

Predictive Analysis (Classification)

Classification Accuracy

- We cannot confirm which method preforms best based on the test set.

- Same Test Set scores may be due to the small test sample size. Therefore, we tested all methods based on the whole Dataset.

- The scores of the whole Dataset confirm that the best model is the Decision Tree Model. This model has not only higher scores, but also the highest accuracy.

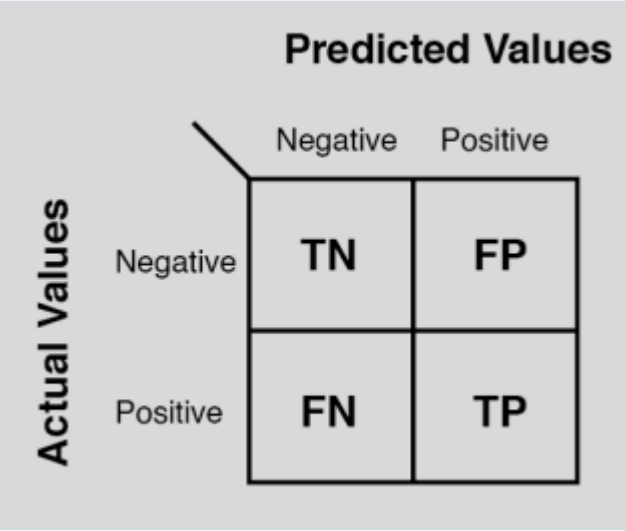
Scores and Accuracy of the Test Set

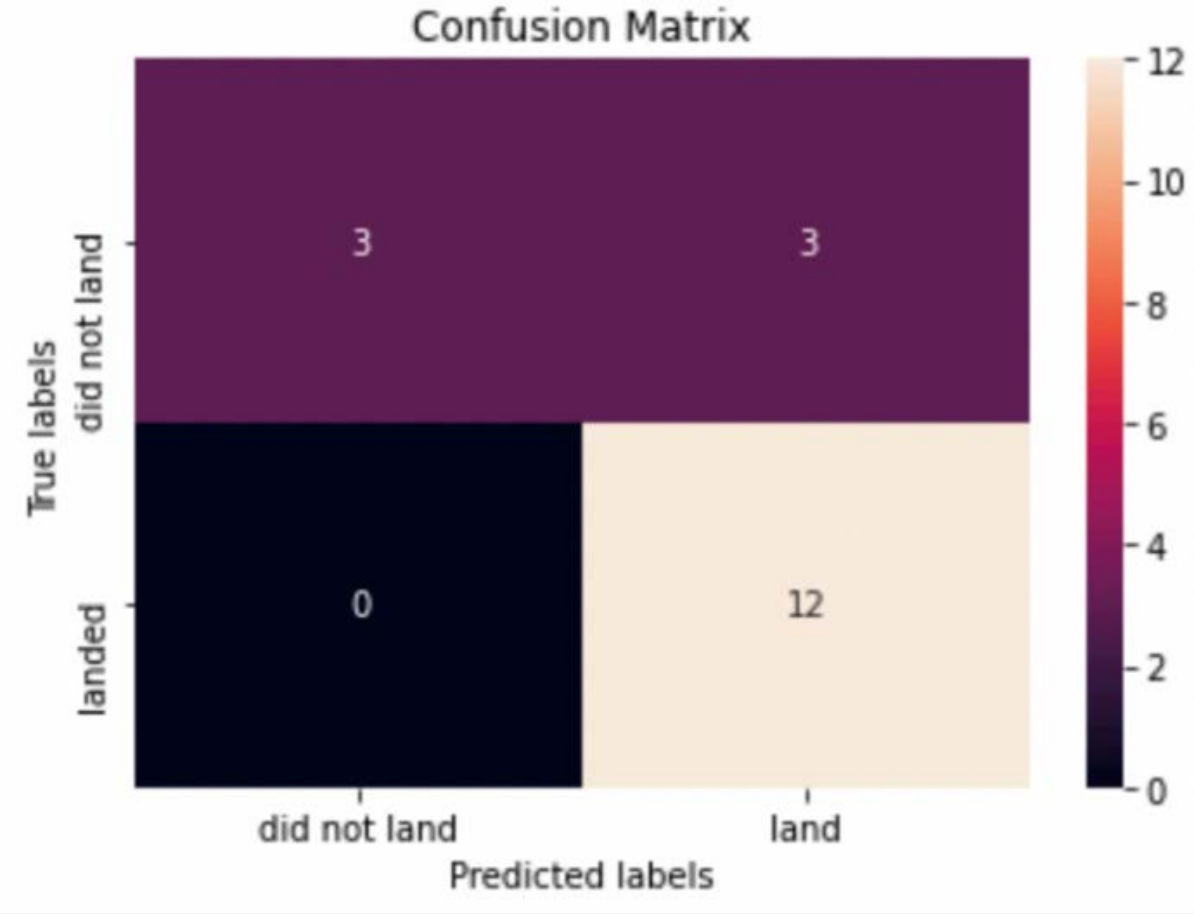
	LogReg	SVM	Tree	KNN
Jaccard_Score	0.800000	0.800000	0.800000	0.800000
F1_Score	0.888889	0.888889	0.888889	0.888889
Accuracy	0.833333	0.833333	0.833333	0.833333

	LogReg	SVM	Tree	KNN
Jaccard_Score	0.833333	0.845070	0.882353	0.819444
F1_Score	0.909091	0.916031	0.937500	0.900763
Accuracy	0.866667	0.877778	0.911111	0.855556

Confusion Matrix

Examining the confusion matrix, we see that logistic regression can distinguish between the different classes. We see that the major problem is false positives.





Conclusions

- Decision Tree Model is the best algorithm for this dataset.
- Launches with a low payload mass show better results than launches with a larger payload mass.
- Most of launch sites are in proximity to the Equator line and all the sites are in very close proximity to the coast.
- The success rate of launches increases over the years.
- KSC LC-39A has the highest success rate of the launches from all the sites.
- Orbits ES-L1, GEO, HEO and SSO have 100% success rate.
